AMIS Crop Calendar
First published 2012 by the Mexican Agri-food and Fishery Information Service, part of the Ministry of Agriculture, Livestock, Rural Development, Fisheries and Food (SAGARPA), in collaboration with The Agricultural Market Information System (AMIS).

© AMIS 2012. All rights reserved.
The Agricultural Market Information System (AMIS) is a G20 initiative to enhance food market transparency and encourage coordination of policy action in response to market uncertainty.

The initial focus of AMIS is on four crops that are particularly important in international food markets, namely wheat, maize, rice and soybeans. AMIS seeks to strengthen collaboration and dialogue among main producing, exporting and importing countries.

**About this calendar**

The monitoring of global markets requires a close watch of crop development in each country/region during the growing season. It is for this reason that an easy-to-use crop calendar covering the most important producing countries could be a valuable tool for market analysis.

This document was produced with the collaboration of the Mexican Agri-food and Fishery Information Service, which is part of the Ministry of Agriculture, Livestock, Rural Development, Fisheries and Food (SAGARPA), during the Mexican Presidency of the G20 Group.
AMIS Participating Countries

The countries included in this calendar are those taking part in the AMIS initiative, that is the G-20 countries plus Spain, along with the seven invited participating countries (Egypt, Kazakhstan, Nigeria, the Philippines, Thailand, Ukraine and Viet Nam).

Overall AMIS countries account for the bulk of production and exports of the four crops currently covered under the initiative.
Crops
Wheat

Wheat is one of the first cereals known to have been domesticated. Its origin can be traced back to at least 11,000 years ago in the Nile Delta and Mesopotamia. There are several domesticated wheat varieties, including hybrids, but most often, the distinction is made between soft and hard (durum) wheat.

Soft wheat is by far the most important for production. It is used for food preparations, but lower quality supplies are commonly destined to feed and, in recent years, also for the production of bio-ethanol.

Hard/durum wheat, the production of which is far smaller than that of soft wheat, is largely used as ingredient for producing semolina and pasta. A number of countries grow two wheat crops per year: the winter wheat and spring wheat crops, named after the period of their planting.
Wheat production

Global production of wheat averaged 680 million tonnes in 2009-2011, with close to half of the world output coming from the EU, China and India. Overall AMIS countries accounted for 87 percent of the total. About 132 million tonnes of wheat (including wheat flour) were traded internationally in the same period, of which some 97 percent were exported by AMIS countries. AMIS countries accounted for a much smaller share of world wheat imports, of 49 percent.

Rice

Rice is a cereal grain thought to have originated in the Yangtze River valley in China where it was domesticated at least 10,000 years ago. Despite its Asian origins, rice is widely cultivated in the five major continents under a wide range of ecologies and climates. Rice is mainly an annual crop, even though it may survive as a perennial.

It is grown predominantly under flooded conditions, as this facilitates fertilization and reduces the incidence of weeds and pest plants. More than one rice crop may be cultivated every season, especially under the tropical and sub-tropical climates.

There are two major rice varieties grown, Indica and Japonica, but popular strains also include Basmati, Hom Mali and other aromatic rices. Despite its migration to other regions, Asia remains the hub of rice production, with many countries in the region growing more than one crop per season. Rice is principally a food commodity, with only a few countries diverting supplies to feed or industrial uses.
Rice production

Global production of rice averaged 469 million tonnes in 2009-2011, in milled rice equivalent, with more than half concentrated in China and India. Overall, AMIS countries accounted for 78 percent of the total. About 32 million tonnes of rice were traded internationally in the same period, 78 percent of which were exported by AMIS countries. On the other hand, AMIS countries accounted for only 43 percent of world rice imports.

Maize

Maize (also known as corn) is a cereal grain, believed to have been domesticated at least 7,000 years ago when it was grown in Central Mexico. Maize is an annual plant with high productivity and exceptional geographic adaptability. There exist several hybrids of maize, each with their own specific properties and kernel, but maize is generally categorized into two broad groups: yellow maize and white maize, depending on their colour and taste. Yellow maize constitutes the bulk of world production and international trade. It is grown in northern hemisphere countries where it is traditionally used for animal feed. In addition, maize has a wide range of industrial applications, including the production of ethanol. White maize cultivation, which requires more favourable climatic conditions than yellow maize, is mainly produced in the United States, Mexico and in a few countries in southern Africa. It is generally considered a food crop. Production of genetically modified maize has gained ground in recent years and now represent an important share of overall production.
Global production of maize averaged 853 million tonnes in 2009-2011, with more than half concentrated in the United States of America and China. Overall, AMIS countries accounted for 91 percent of the total. About 96 million tonnes of maize were traded internationally in the same period, 93 percent of which were exported by AMIS countries. On the other hand, AMIS countries accounted for about 59 percent of world maize imports.

Soybeans

Soybeans is a legume classified by FAO as an oil crop. References to the crop have been found in China around 3,000 years ago. Soybeans were originally used for crop rotation, as a nitrogen fixing plant, and for the production of fermented food products. Until fairly recently, cultivation was limited largely to Asian countries and only gained popularity in the America and Europe in the early 1900s.

Although in some countries soybeans are transformed at the local level into food products for direct human consumption, much of today’s production is crushed at industrial scale to obtain soybean oil and soybean meal, which, respectively, account for about one third and two thirds of the crop’s economic value. Soy-oil and soy-meal are consumed worldwide as food and animal feedstuff respectively. In recent years, soybean oil also started to be used for the production of bio-diesel.

Commercial production of genetically modified soybeans has increased fast in recent years, with important implications for consumption and trade.
Soybeans production

Global soybean production averaged 254 million tonnes in 2009-2011. Production is highly concentrated, with some 80 percent originating in three countries alone, the United States of America, Brazil and Argentina. As a group, AMIS countries account for 95 percent of world production. Out of today’s global soybean trade of around 92 million tonnes, AMIS countries account for about 93 percent of world exports and 90 percent of global imports.
